**Table S1.** Computational relative energies of the optimized  $\text{PrB}_2^-$  anion based on different initial structures ( $C_{\infty v}$ ,  $C_{2v}$ , and  $C_s$ ) and spin multiplicities ( $2S+1$ ).<sup>a</sup> The calculations were done at the level of PBE0/TZP using ADF code.

|                | Singlet            | Triplet           | Quintet            | Septet |
|----------------|--------------------|-------------------|--------------------|--------|
| $C_{\infty v}$ | 112.75             | 45.47             | 50.93              | 81.80  |
| $C_{2v}$       | 33.73              | 0                 | 26.13              | *d     |
| $C_s$          | 32.66 <sup>b</sup> | 0.68 <sup>b</sup> | 24.05 <sup>c</sup> | *d     |

<sup>a</sup> The initial structure of  $C_s$  has a 135-degree  $\angle\text{Pr-B-B}$  bond angle. Energies are given in kcal/mol and are relative to the lowest value ( $C_{2v}$  triplet, -498.68 kcal/mol). <sup>b</sup> The optimized structure is of  $C_{2v}$  symmetry. <sup>c</sup> The optimized structure is close to  $C_{2v}$  symmetry. <sup>d</sup> Not converged.

**Note on the ground state of neutral  $\text{PrB}_2$ :** As shown in Figure 2 and Table S1,  $\text{PrB}_2^-$  anion has a cyclo  $C_{2v}$  triangular geometry with a triplet  $^3\text{B}_2$  ground state, which has an Kohn-Sham electron configuration  $(4a_1)^2(3b_2)^2(2b_1)^2[(5a_1\alpha)^1(4b_2\alpha)^1](5a_1\beta)^1(6a_1\alpha)^1(7a_1\alpha)^1(6a_1\beta)^1$ , where  $(5a_1\alpha)^1(4b_2\alpha)^1$  corresponds to the quasi-atomic Pr  $f^2$  configuration and  $(\dots)^2$  represent a pair of electrons on less spin-polarized orbitals. After comparing the energies of different electron occupation at PBE0/TZP level, we have determined that the neutral  $\text{PrB}_2$  also has a  $C_{2v}$  geometry with quartet  $^4\text{B}_2$  ground state of  $(4a_1)^2(3b_2)^2(2b_1)^2[(5a_1\alpha)^1(4b_2\alpha)^1](6a_1\alpha)^1(5a_1\beta)^1(7a_1\alpha)^1$  electron configuration. The calculated energy of this  $^4\text{B}_2$  state of the neutral molecule is -463.11 kcal/mol, while the optimized  $^2\text{B}_2$  doublet state of  $(4a_1)^2(3b_2)^2(2b_1)^2[(5a_1\alpha)^0(4b_2\alpha)^1](5a_1\beta)^1(6a_1\alpha)^1(7a_1\alpha)^1(6a_1\beta)^1$  electron configuration lies at -448.52 kcal/mol. A gap of about 15 kcal/mol is sufficient to demonstrate that the ground state of  $\text{PrB}_2$  is the  $^4\text{B}_2$  quartet.

**Figure S1.** The CASSCF-(12e,14o) natural orbitals of the  $^3B_2$  ground state of triangle  $\text{PrB}_2^-$  ion and their natural orbital occupation numbers (NOONs) calculated with MOLPRO code. Isovalue = 0.05 for all orbitals; colour codes for atoms: olive, Pr; pink, B. The orbitals are labelled to match the  $\alpha$  set of K-S MOs if possible.

**Selection of the active space:** From Figure 4, one can see that Pr(III) has five significant bonding interactions with  $\text{B}_2^{4+}$  (MOs =  $4a_1$ ,  $3b_2$ ,  $2b_1$ ,  $6a_1$ , and  $7a_1\alpha + 5a_1\beta$ ) and two non-bonding 4f orbitals (MOs =  $5a_1\alpha$  and  $4b_2\alpha$ ), so six Pr related MOs were included in the active space. On the other hand,  $\text{B}_2^{4+}$  has eight valence MOs, and thus our CASSCF calculation has a total of 12 electrons in 14 MOs, denoted as CASSCF-(12e,14o). From the calculated results,  $7a_1^*$ ,  $5b_2$ ,  $\pi_{2p}^*$  natural orbitals having slightly larger NOONs correspond to B-B  $\sigma_{2p}^*$  and  $\pi_{2p}^*$  orbitals. The NOONs of other natural orbitals are close to integers and the first configuration dominates in the CI vector, indicating that the single-configurational methods like DFT and CCSD(T) would not have extremely large error for describing the bonding between Pr and  $\text{B}_2$  moiety of these systems.

**Table S2(a).** The CASSCF-(12e,14o) CI vectors of  $C_{2v}$  triangle  $\text{PrB}_2^-$  ion. The order of the labels of orbitals follows Figure S1.<sup>a</sup>

**Figure S3.** The global-minimum structures of  $\text{PrB}_2^-$  calculated with PBE0/TZP considering scalar ZORA relativistic effect (SR) or also with ZORA noncollinear spin-orbit coupling (SO), using the ADF code, and the global-minimum structure calculated with DKH2 Hamiltonian, PBE0 functional, SARC-DKH2 basis set for Pr, and cc-pVTZ basis set for B, using the Gaussian 16 code. The bond lengths are given in Å and the bond angles are given in degree (°). Colour codes: olive – Pr; pink – B.

### Implication of SO calculations

Comparing Figure S7 and Figure 1, and Table S8 and Table 2, one can see that the change in geometry and electronic structure when including SO coupling is minimal, indicating that the spin-orbit coupling effect for the geometry and ground-state properties of this molecule is not significant.

**Table S5.** Cartesian coordinates for optimized  $\text{PrB}_2^-$  and  $\text{PrB}_2$  with PBE0 functional.

**Table S9(b).** The integrated ring current of PrB<sub>2</sub><sup>-</sup> on its B-B bond and Pr-B bond calculated by PBE0, BHandHLYP, and B3LYP using the Gaussian 16 program with MWB28 ECP and basis set for Pr and cc-pVTZ basis set for B. A positive ring-current value indicates the presence of a diamagnetic induced current. The centre of the ring current in Figure 6(b) (coordinates in Table S5) is chosen to be the centre point for these calculations.

| PrB <sub>2</sub> <sup>-</sup> Integrated Ring Current | PBE0 | BHandHLYP | B3LYP |
|-------------------------------------------------------|------|-----------|-------|
| Along B-B Bond                                        | 7.2  | 6.7       | 6.9   |
| Along Pr-B Bond                                       | 6.3  | 5.9       | 6.1   |

**Figure S6.** Isosurfaces of AICD (isovalue = 0.03) for  $\text{PrB}_2^-$  and  $\text{B}_3^-$  generated from all valence electrons, the delocalized  $\pi$  MO, and the delocalized  $\sigma$  MO, calculated by AICD and Gaussian 16 code with MWB28 ECP and basis set for Pr and cc-pVTZ basis set for B. Green arrows on the surfaces show the strength and the direction of the current induced by the magnetic field, which is pointing out of the molecule plane. The clockwise current represented by red arrows is diatropic and indicates aromaticity.

**Figure S7.** Results of bifurcation analysis of ELF- $\sigma$  and ELF- $\pi$  on  $\text{PrB}_2^-$ ,  $\text{B}_3^-$  and  $\text{C}_3\text{H}_3^+$  by using Gaussian 16 program. Some of the critical points are pointed out by red arrows; ELF- $\pi$  do not have any reasonable critical points. Colour codes for atoms: olive – Pr; pink – B; cyan – C; white – H.

### Implication of bifurcation analysis of ELF

The process of bifurcation analysis is to increase the isovalue of the isosurface of ELF to see when it breaks into several disconnected parts. The higher the isovalue of the breaking critical point is, the stronger the delocalization of the electrons would be. ELF- $\pi$  of all these systems do not break until isovalue reaches 0.99999, showing strong  $\pi$ -aromaticity. In  $\sigma$  systems, the critical point of  $\text{PrB}_2^-$  is closer to the known  $\sigma$ -aromatic  $\text{B}_3^-$ , providing evidence that  $\text{PrB}_2^-$  also possesses  $\sigma$ -aromaticity.

**Table S10.** Energy decomposition analysis of  $\text{PrB}_2^-$  and the associated deformation densities  $\Delta\rho$  of the most important pairwise orbital interactions  $\Delta E_{\text{orb}}$  (Isovalue = 0.002 au for  $\alpha$ ,  $\beta$ ; Isovalue = 0.004 au for  $\alpha + \beta$ , unless specified). The direction of the charge flow is red to blue. The calculations were carried out at the level of PBE0/TZP using ADF code. Energy values are given in kcal mol<sup>-1</sup>. Colour codes for atoms: olive – Pr; pink – B.

**Figure S8.** Results of PIO analysis by using Gaussian 16 program on  $\text{PrB}_2^-$  with Pr and  $\text{B}_2$  as two fragments. (a) Top four PIOs of each fragment. The occupation numbers are given as ON near each PIO pair, and the PIO-based bond indices (PBI) and its percentage contribution to the total interactions between two fragments are shown below each pair. (b) Top four PIMO pairs. Note that the phase of each PIO is naturally paired up with its counterpart. Isovalue = 0.03 for all orbitals; colour codes: olive – Pr; pink – B.
